Ignited Minds A P J Abdul Kalam 2014-11-01 What is it that we as a nation are missing? Why, given all our skills, resources and talents, do we settle so often for the ordinary instead of striving to be the best? At the heart of Ignited Minds is an irresistible premise: that people do have the power, through hard work, to realize their dream of a truly good life. Kalam's vision document of aspiration and hope motivates us to unleash the dormant energy within India and guide the country to greatness.

How to Get a First Thomas Dixon 2004-08-05 In this informative guide, Thomas Dixon argues that you do not have to be a genius to get a first at university. He sets out to de-mystify first-class degrees in the arts, humanities and social sciences, clearly articulating the difference between the excellent and the merely competent in undergraduate work. This concise, no-nonsense guidebook will give prospective and current students advice on teaching and learning styles that prevail in university and on how to manage their two most important resources - their time and their lecturers. In an accessible and entertaining style, the author looks at subjects such as: making the transition from school to university developing transferable skills making use of lectures and seminars using libraries and the Internet note-taking, essays, seminars and presentations common mistakes to avoid writing with clarity and style revision and examinations. Illustrated with many examples from a range of academic disciplines, How to Get a First is an all-purpose guide to success in academic life. Visit the companion website www.getafirst.com

Climate Change and Microbes Javid Ahmad Parray 2022 "book provides an enlightening picture of the role of microbes for sustaining life systems and how climatic factors change the course of the processes. Climate Change and Microbes: Impacts and Vulnerability explores the little-addressed issue of the effects of climate change on microbial ecosystems and the influence of climate change on microbiome diversity across various habitats and regions. Recent years have seen the evidence that microbial communities are neither immune to disruption nor do they have the capacity to recover completely after a stressful climate event. This volume documents the important role of microorganisms as climate engineers and considers mitigation and adaptation strategies as well. It goes on to present the research that addresses a diverse array of topics on the impact of climate change on plant-microbe interactions and microbial aquatic life, change-induced aggravations in microbial populations and processes. The book also addresses microbial foodborne diseases resulting from challenging climates. Other topics include algae as indicators of climate change and strategies for facilitating sustainable agro-ecosystems. This book will be immensely helpful in the study of plant microbiology, agricultural sciences, biotechnology, climate science, and environmental microbiology. It will also be applicable to the field of microbial biotechnology, agricultural, and other life and environmental sciences"--

Genetics and Biotechnology Ulrich Kück 2013-03-09

Genetics and Biotechnology Ulrich Kück 2013-03-09 Mycology, the study of fungi, originated as a subdiscipline of botany and was a descriptive discipline, largely neglected as an experimental science until the early years of this century. A seminal paper by Blakeslee in 1904 provided evidence for self incompatibility, termed "heterothallism", and stimulated interest in studies related to the control of sexual reproduction in fungi by mating-type specificities. Soon to follow was the demonstration that sexually reproducing fungi exhibit Mendelian inheritance and that it was possible to conduct formal genetic analysis with fungi. The names Burgeff, Kniep and Lindegren are all associated with this early period of fungal genetics research. These studies and the discovery of penicillin by Fleming, who shared a Nobel Prize in 1945, provided further impetus for experimental research with fungi. Thus began a period of interest in mutation induction and analysis of mutants for biochemical traits. Such fundamental research, conducted largely with *Neurospora crassa*, led to the one gene: one enzyme hypothesis and to a second Nobel Prize for fungal research awarded to Beadle and Tatum in 1958. Fundamental research in biochemical genetics was extended to other fungi, especially to *Saccharomyces cerevisiae*, and by the mid-1960s fungal systems were much favored for studies in eukaryotic molecular biology and were soon able to compete with bacterial systems in the molecular arena.
